

# Field Listing Death rate

This entry gives the average annual number of deaths during a year per 1,000 persons at midyear, which is also known as "crude death rate." The death rate, while only a rough indicator of the mortality situation in a country, accurately indicates the current mortality impact on population growth. This indicator is significantly affected by age distribution, and most countries will eventually show a rise in the overall death rate, in spite of continued decline in mortality at all ages, as declining fertility and increased lifespans result in an aging population.
